Verner E. Suomi and Robert J. Parent

On 6 December 1966, the Applications Technology Satellite (ATS-1) was launched. We have had the benefit of the geostationary perspective for 40 years!

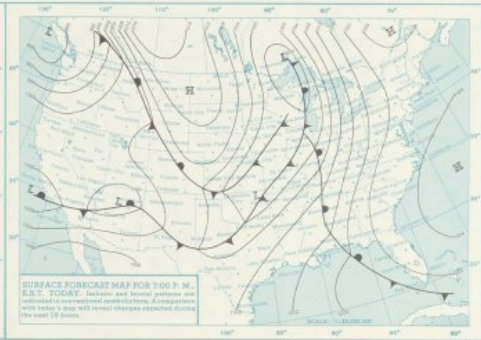

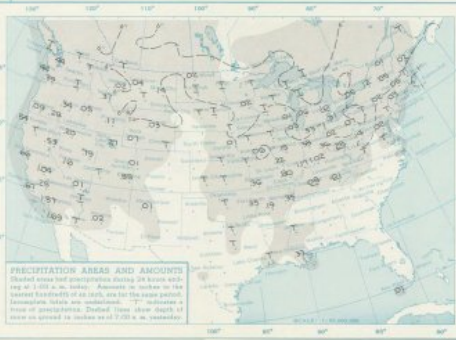

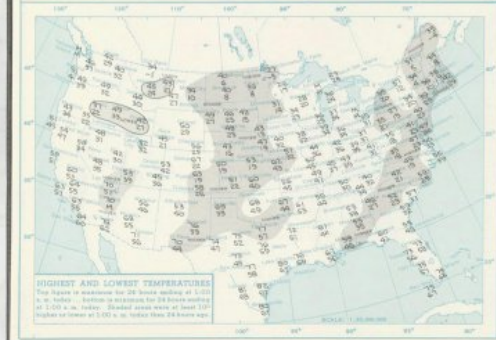

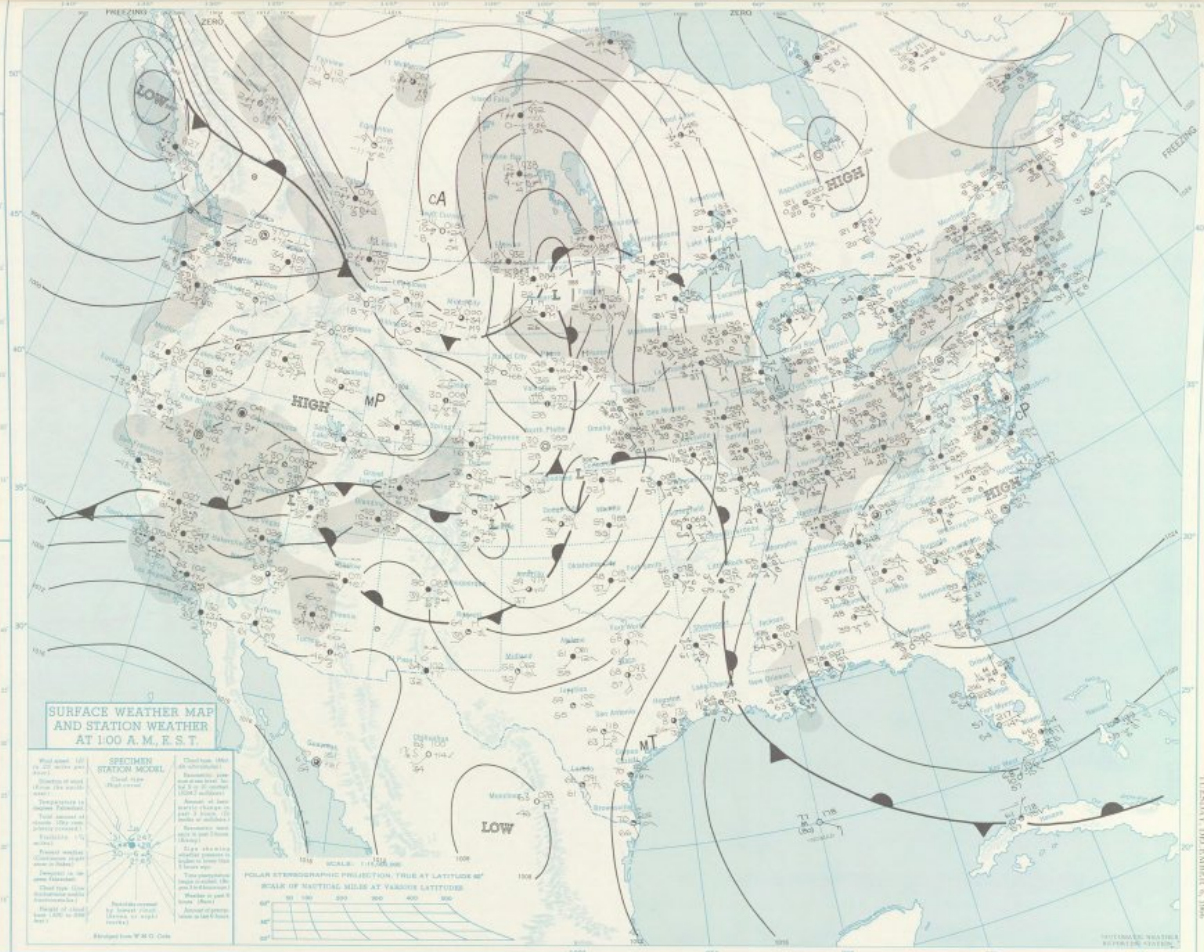

ATS-1's spin scan cloud camera (UW's Suomi and Parent 1968) provided full disk visible images of the earth and its cloud cover every 20 minutes. The spin scan camera on ATS-1 occurred because of an extraordinary effort by Verner Suomi and Homer Newell, when the satellite was already well into its fabrication.

Professor Suomi and McIDAS

(Man computer Interactive Data Access System)

“AS HE WATCHED A FOOTBALL GAME ON TELEVISION, HE REALIZED THAT WHAT HE REALLY WANTED WAS AN INSTANT REPLAY OF WEATHER PICTURES.”

VERNER SUOMI (1915-1995)

1972 – “McIDAS”

2007 – “McIDAS-V”

Including VIS-AD and HYDRA

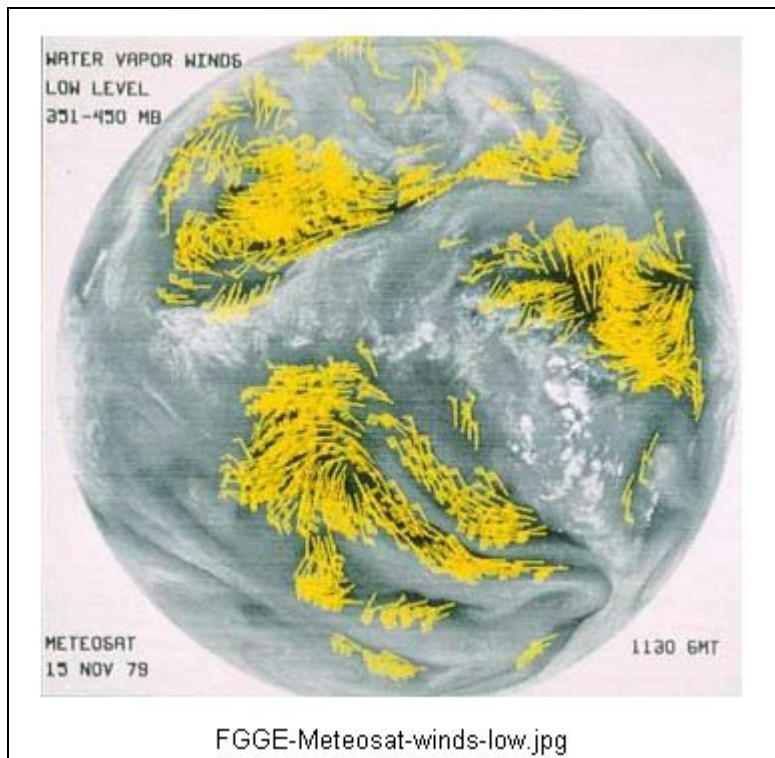

The Man-computer Interactive Data Access System (McIDAS), like so many of his ideas, just popped into his head. As he watched a football game on television, he realized that what he really wanted was an “instant replay of weather pictures.” He wanted to slow them down, replay them, and have a computer analyze them. With this simple concept, he went to SSEC’s engineers and programmers. In 1972 Suomi introduced McIDAS.

McIDAS proved invaluable in analyzing wind data collected during the First GARP Global Experiment (FGGE) in 1978. Instrumental in planning the experiment’s objectives and processes, Suomi came up with the idea of using observed cloud movement to determine wind speed and direction, especially over the tropics. McIDAS is in use today by the National Storm Prediction Center, the National Weather Service, the National Transportation Safety Board, NASA Goddard Space Flight Center, and many other government agencies and private companies, including meteorological centers in Spain, Australia, and Japan.

Verner Suomi developed methods of calculating wind speed and direction from a series of pictures of moving clouds. The image above shows wind vectors over the U.S. West Coast derived from Geostationary Operational Environmental Satellite (GOES) imagery. Color corresponds to altitude (Red indicates high winds, blue mid-level winds, and yellow low altitude winds), while the number of bars on each line indicates velocity. (Image courtesy NOAA [Experimental High Density Winds](#))

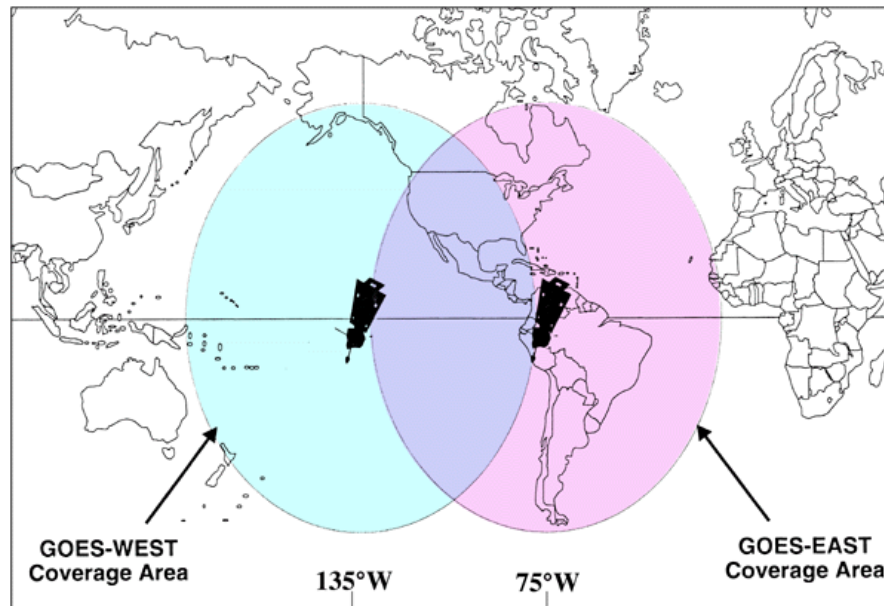

Water vapor tracked “winds” from Meteosat during FGGE (the **F**irst **G**lobal **A**tmospheric **R**esearch Program (**G**ARP) **G**lobal **E**xperiment)

(15 Nov 1979)

The **GOES** are **launched** by **NASA** at Cape Canaveral, Florida.

The GOES are **operated** by the National Oceanic and Atmospheric Administration (**NOAA**) at 75° and 135° west longitude .

Physical vertical retrievals from geostationary orbits – another NOAA and Wisconsin connection

Bill Smith - Suomi student at UW; NOAA researcher, expanding physical iterative sounding retrievals from POES (HIRS) to GOES/VAS, as NOAA/NESDIS Development Lab moved to UW-SSEC (mid 1970s); became first director of CIMSS (early 1980s); went to NASA Langley to continue development of a geostationary hyper-spectral sounding capability; now at Hampton University as well as part time at UW-SSEC, still promoting geo hyper-spectral

Kit Hayden – NOAA/NESDIS DL member and retrieval developer (*retired*)

Paul Menzel – Suomi colleague; multi-spectral remote sensing expert and teacher at UW-SSEC; senior scientist for NOAA/NESDIS/ORA; first Suomi Distinguished Professor at UW-AOS

Ma Xa Lin – SSEC geo retrieval algorithm developer (*California*)

Allen Huang – Suomi student at UW; hyper-spectral remote sensing advocate and expert extraordinaire

Jun Li – SSEC geo retrieval algorithm developer
