## RAINFALL

The records of the daily rainfall（which were commenced by the late Sir George 8 ． hingoton as early as 1839 no far as Adelaida in roncerned，and have beyen aystemationlly ountinued and greatly extended since 1856 by Mr．C．Todd，Governinent Meteorologiat，cte．） Uend to show that theoceupation and enltivation of the country has not to any appreciable extent either increased or diminished the average atinual rainfall in any given locality．They abo show that the fluctuations in the annual elepth of rain are not reducible to any law of periodicity．Mr．Todd has established over 340 stations，extending from the northern coast of this island continent to the Southern Osean， at which the depth of rain is taken and re－ conded every morning at 9 oclock for the pre－ vivas twenty－four hours．These observations show very great differenees in the amual depths of rainfall in differeat localitice．As a general rule the rains are the most copuas within the tropies and on the sunthem districts extending trim 160 to 200 miks inhart，white in some perts of Central Australia it seldom exceeds four or five isches per anaum．Thas at Pal－ merretene．Southport，\＆c．，the annual average exceeds 63 mekes，while in the arid oonatry eant of lake Eyre it scarcely excoeds 4 inches． Taick 1.
 Aitelibile from 1830 to Isor，incluwive，ukpseswil in ivelies astot reccitacts：－

It does not appear possible to deduce from this table any support of the theosies often advanced of the connection between celestial phenomena and the fall of rain．Indeed，if sny such connection does exist at all，it must affect the meteorelogical condition of the earth is a whole．And though scientists prufess to have traced a connection between the elevea－ ycars period of solar spots and terrestrial magnetism and electricity，which future obser－ vitions may or may not confirm，posibibly another century of recorded observations made in both bemispheres will scarcely suffice to establish the theory of the influsence of solar spots in angmenting or diminishing the rainfall ujon the earth＇s surface，assuming such in－ ffucnce to exist．So with regard to the local effects upon the annnal rainfall，at one time very generally believed to result from the de－ struction of the primitive foreste．The early settlers will remember that on their arrival the site of Adelaide and the surrounding country was heavily tumbered，especially to the west－ ward．which was known as the＂Black
was meaviy umperea，especiany to the wesc－ ward，which was known as the＂Black Forest；＂yet the removal of hundreds of thousands of tons of timber since then does not appear to have had any appreciable effeet in permanently diminiahing the average fall of rain．This will appear evident from an inspection of the following：－
tables if．
Showing the aggregate depth of rain registered at Atelaide from low to 1 spo inclusive，with the anmenal average，calculated to the end of each j－ar：－

We may here state that the greatest depth of rain registered in Adelaide in one month was 78 inches，in June，1847，and the greatert in one day 3.5 inches，on March 5， 1878 ．

The following table illustrates the important bearing which the rainfall has upon the agri－ cultural interent ：－

Table III．

This table illus ases the general rule that copious rains tend to produce an abundant harvest，and vice vers．We think we are justified in saying that there has been no instance of a defective fall of rain during the growing months that was followed by a good average yield of wheat．The year 1874 looks
average yield of wheat. The year 1874 looks at first sight as an exceptionsl case, but it is not so, for of the 17.173 inches recorded that year 15.177 inches fell between April and October. On the other hand 1857 was the menorable red-rust year, and in 1871 the rainfall from April to October was but 14835 inches, thus below that of 1874.

Table IV.
The following tahle shows the fall of rain is Aclelaide daring 1590 and the number of wet dyss with a comparative statement of the rainfall during the corresponding period of previons gears, exprewed in inches and decizuals:-

| Menths. |  | 1800. | $\begin{aligned} & \text { Wet } \\ & \text { dayn. } \end{aligned}$ | $\begin{aligned} & \text { Wettrat } \\ & \text { year, } \\ & \text { 15e9. } \end{aligned}$ | Drient year, 1576. | Aver: 1539 tolow |
